

This invention provides an intrinsic and compact way of covering used sanitary napkins for disposal.

This is accomplished via an internal covering. This covering is nestled inside the sanitary or (Urinary incontinence device). Attached to the covering is a string that leads to the outside of the napkin. Pulling the string brings the covering from inside the napkin to the outside---for the purpose of covering the used napkin.

With this intrinsic system of covering, the used sanitary napkin can be covered before disposal and the problem of disposing used uncovered sanitary napkins is solved. Also, there is no longer a need to find newspaper or other ways to cover the used sanitary napkin.

BRIEF DESCRIPTION OF THE DRAWINGS

The present invention will now be described in greater detail with reference to an embodiment represented in the drawings. The figures show:

FIG. 1 -A top cutaway view of the present invention;

FIG. 2 - A top view of the present invention;

FIG. 3 - The embodiment for disposal;

FIG. 4 and 4a - The embodiment pre and post package for disposal.

DETAILED DESCRIPTION OF THE INVENTION

According to a preferred embodiment, and as can be seen from FIG. 1-4, the sanitary napkin 1 of the present invention is composed of a planar and elongate absorbent main body 3, and two longitudinal side edges, 4. These edges are rectilinear with two transverse curvilinear ends. The main body is composed of a liquid permeable cover layer, which is made to be in contact with the wearer for the purpose of absorbing menstrual flow. Under the absorbent layer is an impermeable layer, which prevents absorbed liquid from leaking out of the sanitary napkin. Lastly, there is an outer layer, which is comprised of adhesive adapted to contact and affix to the user's undergarment. None of these layers are demonstrated. This is the usual embodiment of the sanitary napkin.

The sanitary napkin 1 further comprises an inner material 2 used to cover the used sanitary for disposal. This material is nestled below the impermeable layer and above the outer adhesive layer. This material is essentially a plastic bag with an attached string.

In order to use the sanitary napkin, the string is pulled which brings the bag 2 from inside the sanitary napkin to the outside while still attached to the sanitary napkin. The used sanitary napping is then folded inside the bag for disposal. FIG. 3 shows the embodiment for disposal. FIG.4 and FIG. 4a shows the embodiment of the sanitary napkin pre and post package respectively for disposal.

The material of the inner bag 2 of FIG. 1 is not limited to plastic. Also, the bag may be placed above or below the impermeable layer of the sanitary napkin. The bag may be placed toward the front, middle, or back of the sanitary napkin. Similarly, the inner bag may be placed in other devices, namely incontinence pads.

A preferred embodiment has been described; but the scope of the present invention may include other variations, and is limited only by the contents of the aforementioned claims, the possible equivalents being included therein.
